Naan Mudhalvan – ServiceNow / IT Service Management

CERTIFICATE

This is to certify that the project report entitled “ServiceNow Administrator Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer” is a bonafide work carried out by the students listed below during the academic year 2026– 2027 as part of the Naan Mudhalvan training/project work.

- Sivasakthi B
- Stalin R
- Sanjeevi Priyan M
- PRAVEEN M
- SANTHOSHKUMAR K

The project focuses on streamlining IT procurement by automating standard laptop order processing in ServiceNow using Flow Designer. The project demonstrates request capture, approval/validation, automated task creation, notifications, and controlled fulfilment.

The project work has been completed under the guidance of the concerned faculty/trainer and is submitted for academic evaluation.

Faculty / Trainer Signature

Head of Department

DECLARATION

I/We hereby declare that the project report entitled “ServiceNow Administrator Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer” is prepared as part of the Naan Mudhalvan training/project activity. The report presents the concepts, requirement analysis, design, implementation approach, testing procedure, and expected results of the ServiceNow Flow Designer automation.

The project uses ServiceNow concepts related to IT procurement, request processing, approvals, flow automation, task generation, and notifications. Wherever external technical documentation has been consulted, it is acknowledged in the References section.

Place: _____

Date: _____

Signature: _____

ACKNOWLEDGEMENT

We sincerely thank our college management and faculty members for providing the opportunity to participate in the Naan Mudhalvan training programme. We are grateful to the trainers and mentors who provided guidance on ServiceNow, IT Service Management, Flow Designer, automation, approvals, and procurement workflows.

We also thank our department for providing the required academic support to complete this project report. Finally, we thank everyone who supported us directly or indirectly during the preparation, testing, and documentation of this project.

1. BRAINSTORMING & IDEATION PHASE

1.1 Project Overview

The project “ServiceNow Administrator Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer” is designed to simplify and automate the process of ordering standard laptops through ServiceNow. The main idea is to replace repetitive manual procurement steps with a controlled workflow.

1.2 Problem Identification

IT teams often receive laptop requests through different channels. Manual validation, approval follow-up, task assignment, and notification can take time and may lead to missed steps. A standardized automated flow can make the process more consistent and easier to track.

1.3 Proposed Idea

The proposed solution is to create a ServiceNow Flow Designer workflow for standard laptop requests. When a request is submitted, the flow validates the request, obtains the required approval, creates fulfilment tasks, updates the request state, and sends appropriate notifications.

1.4 Objectives

- Understand IT procurement request processing in ServiceNow.
- Create a standardized laptop-order workflow using Flow Designer.
- Automate approval and fulfilment activities.
- Generate tasks for the responsible IT/procurement teams.
- Send notifications at important workflow stages.
- Test the automation under different request conditions.
- Document the implementation in a phase-wise format.

1.5 Expected Outcome

The expected outcome is a controlled procurement workflow in which standard laptop requests are processed consistently. The automation should reduce repetitive manual work, improve visibility of request status, and ensure that approval and fulfilment activities are performed in the intended sequence.

2. REQUIREMENT ANALYSIS PHASE

2.1 Functional Requirements

- The system shall allow users to submit a standard laptop request.
- The flow shall identify the request and required procurement information.
- The request shall be routed for approval when approval is required.
- Approved requests shall generate fulfilment/procurement tasks.
- Relevant users or groups shall receive workflow notifications.
- The request state shall be updated according to the workflow stage.
- Rejected or invalid requests shall follow an appropriate alternate path.
- Each major flow condition shall be tested with matching and non-matching cases.

2.2 Non-Functional Requirements

The automation should be understandable, maintainable, consistent, and traceable. Flow steps should have meaningful names and should avoid unnecessary actions. The process should provide predictable status changes and notifications.

2.3 User Requirements

Users need a simple way to request a standard laptop and understand the progress of the request. Approvers need sufficient information to make an approval decision, while IT/procurement teams need clear fulfilment tasks.

2.4 Technical Requirements

- ServiceNow instance with appropriate ITSM/request access.
- Flow Designer.
- A request or catalogue item representing the standard laptop order.
- Approval and task capabilities.
- Notification capability.
- Browser access to the ServiceNow interface.
- Controlled test records or test conditions.

2.5 Requirement Traceability

Request capture is connected to the request/catalogue configuration. Approval is handled through the flow, while fulfilment activities are represented by generated tasks. Notifications communicate important workflow events, and testing verifies that each requirement produces the expected result.

3. PROJECT DESIGN PHASE

3.1 Design Approach

The design separates the project into request submission, validation, approval, fulfilment, notification, and completion stages. This makes it easier to understand which Flow Designer action is responsible for each part of the procurement process.

3.2 Request Design

The standard laptop request acts as the starting point. The request captures the required information such as the requested item, requester, quantity or relevant details, and other fields needed for procurement processing.

3.3 Flow Designer Design

The Flow Designer flow contains a trigger followed by actions and, where required, conditions. The flow can perform approval, create tasks, update records, and send notifications based on the request state.

3.4 Approval Design

When approval is required, the flow routes the request to the appropriate approver. An approved request continues to fulfilment, while a rejected request follows the defined alternate path.

3.5 Logical Flow

User submits standard laptop request → flow is triggered → request details are validated → approval is requested → approval result is evaluated → fulfilment task is created → procurement/IT team processes the order → notifications/status updates are sent → request is completed.

3.6 Design Principles

- Keep each flow step focused on one clear purpose.
- Use meaningful names for triggers, actions, and conditions.
- Automate repetitive procurement activities.
- Keep approval and fulfilment paths easy to trace.
- Test both approval and rejection conditions.

4. PROJECT PLANNING PHASE

4.1 Work Breakdown

- Phase 1: Understand the procurement problem and identify the automation opportunity.
- Phase 2: List functional, non-functional, user, and technical requirements.
- Phase 3: Design the request, trigger, approvals, actions, tasks, and notifications.
- Phase 4: Prepare the implementation and testing sequence.
- Phase 5: Configure and implement the Flow Designer automation.
- Phase 6: Execute test cases and record expected/actual behaviour.
- Phase 7: Prepare the report, screenshots, configuration details, and references.
- Phase 8: Demonstrate the completed procurement automation.

4.2 Implementation Schedule

The implementation is planned in small steps so that each flow component can be tested before moving to the next. First, the standard laptop request and required fields are identified. Next, the trigger, approval, task, notification, and completion actions are configured. After each major step, the request is tested using relevant conditions. Finally, the complete flow is demonstrated and documented.

4.3 Risk Considerations

Possible implementation issues include incorrect trigger conditions, missing approval configuration, incorrect task assignment, duplicate notifications, action sequencing problems, and testing only the successful path. These risks are reduced through meaningful configuration names, controlled test cases, and testing of both successful and alternate paths.

5. PROJECT DEVELOPMENT PHASE

5.1 Development Environment

The project is implemented in a ServiceNow environment using Flow Designer. The standard laptop request provides the input, while Flow Designer manages the automated procurement process.

5.2 Flow Trigger Implementation

The flow is configured with an appropriate trigger so that it starts when a standard laptop request is submitted or reaches the defined procurement state.

5.3 Request Validation

Validation checks whether the request contains the information needed to continue processing. If the defined condition is not satisfied, the flow follows the configured alternate path or requests correction where applicable.

5.4 Approval Implementation

The flow sends the request for approval to the appropriate user or group. The approval result determines whether the request proceeds to fulfilment or follows the rejection path.

5.5 Fulfilment Task Implementation

For an approved request, the flow creates the required fulfilment or procurement task and assigns it to the responsible team. The task provides a clear work item for completing the laptop order.

5.6 Notification and Status Updates

The flow can send notifications when the request is submitted, approved, rejected, assigned for fulfilment, or completed. Record status updates provide visibility into the current stage.

5.7 Implementation Sequence

- Open Flow Designer in the ServiceNow instance.
- Identify the standard laptop request/catalogue item.
- Create the flow trigger.
- Add validation and condition steps.
- Configure the approval action.
- Create the procurement/IT fulfilment task.
- Configure required notifications and status updates.
- Save and activate the flow.
- Submit a test laptop request and verify the complete workflow.
- Test the alternate approval/rejection path.

5.8 Implementation Result

The completed configuration provides an automated path for standard laptop procurement. The project demonstrates the practical use of ServiceNow Flow Designer to coordinate approvals, fulfilment tasks, notifications, and request status changes.

6. PROJECT TESTING PHASE

6.1 Testing Objective

Testing verifies that the Flow Designer automation behaves according to the requirements. The test process checks the normal approval path as well as rejection, invalid-data, and repeated-condition scenarios.

6.2 Test Cases

Test Case	Expected Result	Status
TC01 – Submit laptop request	Request is created and flow starts.	Pass/To be recorded
TC02 – Valid request	Flow continues to approval.	Pass/To be recorded
TC03 – Approval granted	Fulfilment task is created.	Pass/To be recorded
TC04 – Approval rejected	Request follows rejection path.	Pass/To be recorded
TC05 – Task assignment	Task is assigned to the configured team.	Pass/To be recorded
TC06 – Notification	Relevant notification is generated.	Pass/To be recorded
TC07 – Completion	Request reaches the defined completed state.	Pass/To be recorded

6.3 Testing Result

Testing should be completed in the actual ServiceNow instance before final submission. The final report should use the real observed results and screenshots from the user's own configuration. The test table above provides the structure for recording those results.

6.4 Defect Handling

If a flow does not behave as expected, the trigger, condition, approval action, task assignment, notification, and action sequence should be checked. After correction, the same test case should be executed again to confirm the change.

7. PROJECT DOCUMENTATION PHASE

7.1 Purpose of Documentation

Documentation records the project objective, requirements, design, implementation, testing, and final workflow behaviour. It also makes the automation easier to understand and reproduce.

7.2 Configuration Documentation

The Flow Designer configuration should be documented with its name, trigger, conditions, actions, approval step, task creation, notification behaviour, and expected result.

7.3 Flow Documentation Format

Flow Name: _____

Trigger: _____

Condition/Purpose: _____

Approval Action: _____

Fulfilment Task: _____

Notification: _____

Expected Result: _____

7.4 Screenshot Documentation

Screenshots should be taken from the completed ServiceNow configuration. Suitable screenshots include the Flow Designer flow, trigger configuration, approval action, fulfilment task, request record before and after processing, notification result, and final successful behaviour.

7.5 References

ServiceNow learning material and documentation used during the Naan Mudhalvan ServiceNow training should be listed here. Only resources actually consulted for the implementation should be included.

8. PROJECT DEMONSTRATION PHASE

8.1 Demonstration Objective

The demonstration presents the completed laptop procurement automation from start to finish. It should show the project title, the ServiceNow request, the Flow Designer configuration, approval, fulfilment task creation, notification/status updates, and the final result.

8.2 Demonstration Flow

1. Introduce the project title: ServiceNow Administrator Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer.
2. Open the standard laptop request/catalogue item.
3. Submit a test laptop request.
4. Show the Flow Designer configuration.
5. Demonstrate the approval step.
6. Show the fulfilment/procurement task generated after approval.
7. Show the relevant notification and request status.
8. Demonstrate the alternate rejection path where applicable.
9. Summarize the final result.

8.3 Demonstration Evidence

The final evidence should be based on the actual project instance. Screenshots and the demonstration recording should show the implemented configuration and its visible result. The project name should be clearly stated during the demonstration.

8.4 Final Outcome

The project demonstrates practical understanding of ServiceNow Flow Designer for IT procurement automation. The completed work shows how a standard laptop request can be processed through approval, fulfilment, notification, and completion steps in a controlled workflow.

CONCLUSION

The “ServiceNow Administrator Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer” project provides a practical implementation of IT procurement automation in ServiceNow. The project is organized through eight phases beginning with brainstorming and requirement analysis, followed by design and planning, development, testing, documentation, and demonstration.

The implementation focuses on standard laptop request processing, approval automation, fulfillment task creation, notifications, and controlled status updates. It provides an organized method for checking the workflow before final submission. Actual ServiceNow screenshots, observed test results, and demonstration evidence should be inserted after the implementation is completed in the user's instance.
